

API Reference

This document describes the public API of the cache layer.

All methods are safe to call from multiple goroutines.

The cache exposes a single `Cache` type with a small set of methods:

`Get(key string) (Value, bool)`

`Set(key string, value Value, ttl time.Duration)`

`Delete(key string) bool`

`Purge() int`

Errors

All cache errors are returned as sentinels in the second return value.

Use `errors.Is` to compare against the sentinels:

`ErrCacheMiss`

`ErrCacheClosed`

`ErrKeyTooLong`
